**Author M. Name** received his B.S. and M.S. at Purdue University and his Ph.D. from the University of Illinois. Only an introductory calculus course need be considered as a prerequisite or possibly a corequisite to the reading of the book. Circuit elements are introduced and defined here in terms of their circuit equations; only incidental comments are offered about the pertinent field relationships. The book bears the names of the inaugural group of faculty members, past and present, who have devoted their lives to excellence in teaching and scholarship. They were chosen by their students and their peers as Purdue's finest educators.

**R**eading this book is intended to be an enjoyable experience, even though the text is by necessity scientifically rigorous and somewhat mathematical. We, the authors, are trying to share the idea that circuit analysis can be fun. Not only is it useful and downright essential to those who may never analyze another circuit are truly amazed by all the excellent analytical tools that are derived from only **three simple scientific laws**—Ohm’s law and Kirchhoff’s voltage and current laws.

In many colleges and universities, the introductory course in electrical engineering will be preceded or accompanied by an introductory physics course in which concepts of electricity and magnetism are discussed (or reviewed) as needed.

[fpr\_ha]

## New in the Seventh Edition

---

[fpr\_tx]

When the decision to make the seventh edition four-color became official, everyone on the production team moved into high gear to make the most of this exciting opportunity. Countless (I’m sure somebody in accounting counted) drafts, revisions, care was overall content for the benefit of current instructors.

With the mindset that engineering-oriented software packages can be of assistance in the learning process, but should not be used as a crutch, those end-of-chapter problems designated with re always to *check* answers, not provide them.

[fpr\_hb]

## Key Features

In many colleges and universities, the introductory course in electrical engineering will be preceded or accompanied by an physics course in which the basic concepts a background is not a prerequisite, however. Instead, several of the requisite basic concepts of electricity and magnetism are discussed (or reviewed) as needed.

[fpr\_hc]

## Key Features

Only an introductory calculus course need be considered as a prerequisite—or possibly a corequisite—to the reading of the book. Circuit elements are introduced and about the pertinent field relationships.

[fpr\_hd]

**Key Features** In the past, we have tried introducing the basic circuit analysis course with three or four weeks of electromagnetic field theory, so as to be able to define circuit elements more precisely in terms of Maxwell’s equations. The results, especially in terms of students’ acceptance, were not good.

## Changes to the Seventh Edition include

Only an introductory calculus course need be considered as a prerequisite—or possibly a corequisite—to the reading of the book. Circuit elements are introduced and defined here in terms comments are the pertinent field relationships.

[fpr\_in]

1. Numerous new and revised examples, particularly in the transient analysis portion of the text (Chapters 7, 8, and 9).
2. Several new Practical Application sections existing ones were updated.
10. New multimedia software to accompany the book, including a long-anticipated update to the COSMOS solutions manual system created for instructors.

In the past, we have tried introducing the basic circuit analysis course with three or more precisely in terms of of students' acceptance, were not good.

[fpr\_lb]

- *Examples:* An extensive number of worked examples are used throughout contain all the not have to fill in missing steps.
- *Test your understanding:* Exercise or drill problems are included throughout test their understanding of the material just covered.
- *Summary section:* A summary section, in bullet form, follows the text of each chapter. This section summarizes and reviews the basic concepts developed.

This project has been a team effort, and many people have participated and provided things were going. Working with these people has been incredible.

## Acknowledgments

[fprak\_tx]

I am indebted to the many students I have had over the years who have helped in the grateful for their enthusiasm and constructive criticism. The University of New Mexico has my appreciation for an atmosphere conducive to writing this book.

For the Seventh Edition, the following individuals deserve acknowledgment and a debt of gratitude for their time and various versions of the manuscript:

[fprak\_lu]

Miroslav M. Begovic, *Georgia Institute of Technology*  
 Maqsood Chaudhry, *California State University, Fullerton*  
 Wade Enright, *Viva Technical Solutions, Ltd.*  
 A.C. Soudack, *University of British Columbia*  
 Val Tereski, *North Dakota State University*

The comments and suggestions from Drs. Jim Zheng, Reginald Perry, Rodney Roberts, and Tom Harrison of the Department of Electrical and Computer Engineering at Florida A&M University and The Florida State University are gratefully

acknowledged, as is the incredible effort and enthusiasm of Bill Kennedy at the University of Canterbury, who once again proofread each chapter and provided many useful suggestions. Also, a special thanks to Ken Smart and Dermot Sallis for providing components for photographs, Duncan Shaw-Brown and Kristi Durbin for various photography services, Richard Blaikie for his help with the  $h$ -parameter Practical Application, Rick Millane for assistance with the image processing Practical Application, and Wade Enright for supplying numerous transformer photographs (nobody has more transformer pictures). Cadence and the Mathworks kindly provided assistance with computer-aided analysis software, which was much appreciated. Phillipa Haigh and Emily Hewat provided technical typing, photocopying, and proofing at various stages of the project, and certainly deserve written thanks for all their help. I would also like to thank my Department for granting sabbatical leave to start the revision process—meaning that my colleagues kindly stepped in and covered many of my regular duties.

A number of people have influenced my teaching style over the years, including Profs. Bill Hayt, David Meyer, Alan Weitsman, and my thesis advisor, Jeffery Gray, but also the first electrical engineer I ever met—my father, Jesse Durbin, a graduate of the Indiana Institute of Technology. Support and encouragement from the other members of my family—including my mother, Roberta, brothers Dave, John, and James, as well as my parents-in-law Jack and Sandy—are also gratefully acknowledged. Finally and most importantly: thank you to my wife, Kristi, for your patience, your understanding, your support, and advice, and to our son, Sean, for making life so much fun.

## 3.1. INTRODUCTION

---

[bch\_tx]

In the preceding chapter it was assumed that each of the bodies considered could be treated as a single particle. Such a view, however, is not always possible, and a body, of the body will have to be taken into consideration, as well as the fact that forces will act on different particles and thus will have different points of application.

[bchnt\_tx]

Internal forces are the forces which hold together the particles forming the rigid body

Most of the bodies considered in elementary mechanics are assumed to be *rigid*, a *rigid body* being defined as one which does not deform. Actual structures and machines, however, are considered in the study of mechanics of materials.

In this **internal forces** chapter you will study the effect of forces exerted on a rigid body, and you will learn how to replace a given system of forces by a simpler equivalent given force on a rigid body remains unchanged if that force is moved along its line of action (*principle of transmissibility*).

## 3.2 EXTERNAL AND INTERNAL FORCES

Forces acting on rigid bodies can be separated into two groups: (1) external forces and (2) internal forces.

1. The *external forces* represent the action of other bodies on the rigid body under be concerned only with external forces in this chapter and in Chaps. 4 and 5. [bch\_ln]
2. The *internal forces* are the forces which hold together the particles forming the forces will be considered in Chaps. 6 and 7.
3. The *internal forces* are the forces which hold together the particles forming the rigid body. If the rigid body is structurally composed of several parts, the forces forces will be considered in Chaps. 6 and 7.

As an example of external forces, let us consider the forces acting on a disabled truck that three people are pulling forward by means of a rope attached to the front bumper (Fig. 3.1). The external forces acting on the truck are shown in a *free-body diagram* (Fig. 3.2). Let us first consider the *weight* of the truck.

### 3.2.1 External and Internal Forces

[bch\_hb]

Although it embodies the effect of the earth's pull on each of the particles forming the truck, the weight can be represented by the single force  $\mathbf{W}$ . The *point of application* of this force, that is, the centers of gravity can be determined. The weight  $\mathbf{W}$  tends to make the truck move vertically downward. In fact, it would actually cause the truck to move not for the presence of the ground.

#### External and Internal Forces

[bch\_hc]

The ground opposes the downward motion of the truck by means of the reactions  $\mathbf{R}_1$  and  $\mathbf{R}_2$ . These forces are exerted *by* the ground *on* the truck and must therefore be included among the external forces acting on the truck.

**External and Internal Forces** The ground opposes the downward motion of the truck by means of the reactions  $R_1$  and  $R_2$ . These forces are exerted by the ground on the truck and must therefore be included among the external forces acting on the truck. It follows from Eq. (3.1) that, when two vectors  $\mathbf{P}$  and  $\mathbf{Q}$  have either the same direction or opposite directions, their vector product is zero. In the general case when the angle  $\theta$  formed by the two vectors is neither  $0^\circ$  nor  $180^\circ$ , Eq. (3.1) can be given a simple geometric interpretation: The magnitude  $V$  of the vector and must therefore be requires the introduction of Newton's second and third laws and of a number of other

on the three principles of the principle of transmissibility. Comprehensive included among the external forces acting on the product of  $\mathbf{P}$  and  $\mathbf{Q}$  is equal to the area of the parallelogram which and must therefore be included among the external forces acting on the has  $\mathbf{P}$  and  $\mathbf{Q}$  for sides (Fig. 3.7).

Internal forces are the forces which hold together the particles forming the rigid body

[bch\_dftm]  
[bch\_dftx]

**External Force** Therefore, our study of the statics of rigid bodies will be based on the three principles introduced so far, that is, the parallelogram law of addition, Newton's first law, and the principle of transmissibility.

Newton's second and third laws and of a as well. Therefore, our study of the statics of rigid so addition, Newton's first law, and the principle of transmissibility.

[bch\_thtt]  
[bch\_thtx]

### Theorem Head

Let  $(X, Y)$  and  $(Y, B)$  be open topological spaces and let  $f: (X, Y) \rightarrow (Y, B)$  be a spaces map.

- Suppose that  $f$  is continuous.
- Suppose that  $f$  is open. If  $(Y, B)$  and all fibers  $(f(y), Y \mid f(y))$  ( $y \in Y$ ) are, then  $(X, Y)$  is also separable.

[bch\_thla]

[bch\_cott]  
[bch\_cola]

### Proof

- $(\alpha)$  Let  $x \in X$ . Then  $\{x\}$  is in  $X$ , whence  $\{x\}$  is closed in  $X$ .
- Let  $(y_n)_{m, n}$  be a dense sequence in  $(Y, Y)$  and for every  $n \in \mathbb{N}$  let  $(x_{m, n})$  be a dense sequence in  $(f(y_n), Y \mid f(y_n))$ . We show set  $\{x_{m, n}\}$  that  $x_{m, n} \in U$ .

When you consider the tremendous you can see that you can see that the large, comprehensive social, intellectual, and physical changes facing early. For example, the force exerted by a jack placed under the front axle would cause the truck to pivot

about its rear axle. Such a motion is a rotation. It can be concluded, therefore, that each of the external forces acting on a rigid body can, if unopposed, impart to the rigid body a motion of translation or rotation, or both. For example, the force exerted by a jack placed under the front axle would cause the truck to pivot about its external forces acting on a rigid body can, if unopposed, impart to the rigid body a motion of translation or rotation, or both.

### Example 3.1 Polynomial Regression

**Objective:** Fit a second-order polynomial to the data in the first two columns of Table 17.4. It *cannot* be derived from the properties established so far in this text and must therefore be accepted as an experimental law.

The same magnitude and same direction, but acting at a different point, *provided that the two forces have the same line of action*. The two forces  $\mathbf{F}$  and  $\mathbf{F}'$  have the same effect on the rigid body and are said to be *equivalent*.

1. The principle of transmissibility can be derived from the study of the dynamics of rigid bodies, but this
2. Study requires the introduction of of a other concepts as well.
3. Therefore, our study of the statics of rigid bodies will be based on the three principles law of addition, of transmissibility.

The same magnitude and same direction, but acting at a point, provided that the two forces the same effect on the body and are said to be equivalent.

**Solution:** From the given data,

$$\begin{array}{lll} m = 2 & x_i = 15 & x_i = 978 \\ n = 6 & x_i = 115.65 & x_i = 585.6 \\ n = 2.5 & x_i = 225 & x_i y_i = 2488.8 \end{array}$$

Therefore, the simultaneous linear equations are

$$f(x) = a_0(1 - e^{-ax}) + e$$

Solving these equations through a technique such as Gauss eliminations gives same magnitude and same direction, but acting at a different point.

The principle of transmissibility states that the conditions of equilibrium or motion of a rigid body will **surface recombination velocity** if a force  $F$  acting at a given point of the rigid body is replaced by a force  $F'$  of the same magnitude and same direction, but acting at a different line of action. For example, the force exerted by a jack placed under the front axle would cause the truck to pivot about its rear axle. Such a motion is a rotation. It can be concluded, therefore, that each of the external forces acting on a rigid body can, if unopposed, impart to the rigid body a motion of translation or rotation, or both.

**surface recombination velocity** A parameter that relates the gradient of the excess carrier at a of excess carriers.

## Polynomial Regression

### Example 3.1

**Objective:** Fit a second-order polynomial to the data in the first two columns of Table 17.4.

The same magnitude and same direction, but acting at a different point, *provided that the two forces have the same line of action* (Fig. 3.3). The two forces  $\mathbf{F}$  and  $\mathbf{F}'$  have the same effect on the rigid body and are said to be *equivalent*.

**Solution:** From the given data, these equations through a technique such as Gauss eliminations these equations.

$$x_1 = 10 - (1.5)^2$$

$$x_2 = 10 - (2.21429)(3.5)^2$$

$$x_2 = 57 + (1.5)$$

Therefore, the simultaneous linear equations are

$$f(x) = a_0(1 - e^{-a_1x}) + e$$

Solving these equations through a technique such as Gauss eliminations gives same magnitude and same direction, but acting at a different point.

Forces acting on rigid bodies **velocity** can be separated into two groups: (1) external forces and (2) internal forces. The vector product  $\mathbf{P} \times \mathbf{Q}$  will therefore remain that the **surface velocity** line joining the tips of  $\mathbf{Q}$  and  $\mathbf{Q}'$  is parallel to  $\mathbf{P}$ . We write

$$\mathbf{P} = 625 \text{ mW} - 75^\circ \times 5 \text{ mW}/^\circ\text{C} = 250 \text{ mW} \quad (3.1)$$

From the third condition used to define the vector product  $\mathbf{V}$  of  $\mathbf{P}$  and  $\mathbf{Q}$ , namely, the condition stating that  $\mathbf{P}$ ,  $\mathbf{Q}$ , and  $\mathbf{V}$  must form a right-handed triad, it follows that opposite to  $\mathbf{V}$ . We thus write

$$x_1 = 10 - (1.5)^2 \quad (3.2)$$

$$x_2 = 10 - (2.21429)(3.5)^2$$

$$x_2 = 57 + (1.5)$$

The wear rate  $W_r$  thus has the SI unit of square meters. At low limiting pressure  $p_l$  (the force pressing the two surfaces together divided by the area of contact)

$$W_r = KA A p_l$$

where  $K$  = Archard wear constant, (Pa<sup>-1</sup>)

$A$  = area of contact, m<sup>2</sup>

$p_l$  = limiting, Pa

## [bcesu\_tt] SUMMARY

---

[bcesu\_tx] However, as you will see in of transmissibility can be derived from the study of the dynamics of rigid bodies, but this third laws and of a number of other concepts as well.

Therefore, our study of the statics of rigid bodies far, that is, the parallelogram law of addition, Newton's first law, and the principle of transmissibility.

- > An electric field exists in the depletion region due to the net space charge density. The direction of the field the n region to the p region.
- > A potential difference exists across the space-charge region. Under zero applied bias, this po-

tential difference, known as the built-in potential and majority carrier holes in the p region.

- > An applied reverse bias voltage (n region positive with respect to the p region) increases the potential barrier, increases the space charge width, and increases the magnitude of the electric field.

Therefore, our study of the statics of rigid bodies will be based on the three principles introduced so far, that is, the parallelogram law of addition, Newton's first law, and the principle of transmissibility.

# System of Units, Conversion Factors, and General Constants

An alternative design would be to convert the electrical signal from the microphone to an optical signal, which could then be transmitted through a thin optical fiber. The optical signal is then converted back to an electrical signal, which is amplified and delivered to a speaker. A schematic diagram of such a system is such systems would be needed for two-way communication.

Schematic diagram of one-half of a simple fiber optic intercom. We can consider the design of the transmission and reception circuits separately, since the two circuits for the op amp itself. The light output of the LED is roughly proportional to its current, although less so for very small and very large values of current.

## ANALYSIS EXTERNAL AND INTERNAL FORCES

---

The number of links, in a graph may easily be related to the number of branches and nodes. If the graph has  $N$  nodes, then exactly  $(N-1)$  branches are required to construct a tree because the to convert the electrical signal from the microphone to an optical signal, which could then be through a thin signal is then converted back to an electrical signal, which is amplified and delivered to a speaker.

This is the same circuit as shown in Figure 6.3, but with a 2.5-V dc input. Since no other change has been made, the expression we presented as is valid for this circuit as well. To obtain the desired output, we seek a ratio of  $R_f$  to  $R_1$  of  $10/2.5$  or 4.

## Schematics External and Internal Forces

Since it is only the ratio that is important here, we simply need to pick a convenient value for one resistor, and the other resistor value is then fixed at the same time. For example, we could choose.

### *External and Internal Forces*

The ground opposes the downward motion of the truck by means of the reactions  $\mathbf{R}_1$  and  $\mathbf{R}_2$ . These forces are exerted *by* the ground *on* the truck and must therefore be included among the external forces acting on the truck.

The magnitude  $V$  of the vector and must therefore be included among the external forces acting on the product of  $P$  and  $Q$  is equal to the area of the parallelogram which and must therefore be included.

**External and Internal Forces** The ground opposes the downward motion of the truck by means of the reactions  $R_1$  and  $R_2$ . These forces are exerted by the ground on the follows a simple geometric interpretation:

1. Design a diode based circuit to run on a single 9-V battery and provide a reference voltage of 4.7 V.
2. The 1N750 has a current rating of 75 mA. The voltage of a 9-V battery can vary slightly depending on its state of charge, but we this for the present design.

  - > How might a teacher build in for students to support their peers?
  - > How do we design age-appropriate better serve early adolescents expertise of each modifications to support the learning of each student?
4. A simple circuit such as the one shown in Fig. A. 1.4a is adequate for our purposes; the only issue is determining a suitable value.

Forces acting on rigid bodies can be separated into two groups: (1) external forces and (2) internal forces. The vector product  $P \times Q$  will therefore remain that the line joining the tips of  $Q$  and  $Q'$  is parallel to  $P$ . We write

$$P = 625 \text{ mW} - 75^\circ \times 5 \text{ mW}/^\circ\text{C} = 250 \text{ mW} \quad (\text{A.1})$$

From the third condition used to define the vector product  $V$  of  $P$  and  $Q$ , namely, the condition stating that  $P$ ,  $Q$ , and  $V$  must form a right-handed triad, it follows that opposite to  $V$ . We thus write

$$\begin{aligned} x_1 &= 10 - (1.5)^2 \\ x_2 &= 10 - (2.21429)(3.5)^2 \\ x_2 &= 57 + (1.5) \end{aligned} \quad (\text{A.2})$$

The wear rate  $W_r$  thus has the SI unit of square meters. At low limiting pressure  $p_l$  (the force pressing the two surfaces together dividd by the area of contact)

$$W_r = K A p_l$$

where  $K$  = Archard wear constant,  $(\text{Pa}^{-1})$   
 $A$  = area of contact,  $\text{m}^2$   
 $p_l$  = limiting,  $\text{Pa}$

[egl\_tf]

# Glossary

[egl\_tm] **absolute pathname** A pathname which begins with a, indicating that the file must be in an absolute manner—from root. See also relative pathname.

[egl\_df] **access time** One of the time stamps of a file stored in the inode representing the date and time a file was last accessed. A file is considered accessed if it is read, written or executed, and command.

**action** A component of a sed, awk or perl instruction which acts on text specified by an address. It normally uses a single character to represent an action for sed, but could be a complete program in case of awk and perl. Also sometimes known as an internal command.

**address** A component of an the lines to be affected by the action. The specification could be made with a single expression or a pair of them, or any combination of the two.

**alias** Term used to refer to another name of a command sequence, a hostname or an with another email address. Aliasing is available in the C shell, Korn shell and bash to abbreviate long command sequences. DNS uses aliasing to provide a host with another name. sendmail uses aliasing to with another forward mail to another address.

**anonymous ftp** A public ftp site where users use the login name and the email address as the password to gain access. Most downloadable software are hosted in these sites. Doesn't permit uploading of files.

**Apache** The most popular Web server used on the Internet and the standard on Linux systems. Supports persistent connections, virtual hosting and directory access control.

**archie** A TCP/IP application that locates any downloadable file on the most of the anonymous ftp servers on the Net and produces a list of absolute pathnames and FQDNs of the file found. Obsoleted by the Web.

**argument** The words following a command. It can be an option, an expression, an instruction, a program or one or more filenames.

**attachment** A file sent along with an email message. Attachments can be binary files and can be viewed by a mail client either **inline** or using a **plugin** or a **helper application**.

**autosave** Feature of the emacs editor that saves the buffer periodically in a separate file. The autosaved file has a # on either side of its name and can be recovered of the editor.

**background** An environment where a program runs without being waited for by its parent. A command, when terminated by the & symbol, is understood by the shell to run in the background. Unless run with the nohup command, a background job terminates when the user logs out of the system—a restriction that doesn't apply to the C shell and bash.

**base64** A form of encoding used by the modern mailers to convert binary attachments to text form. It converts three bytes of data to four six-bit characters and increases the size of the file by a third.

**BIND** The most widely used DNS implementation (currently). Shipped with most UNIX systems for providing name service. See also **domain name system** and **name server**.

**block device** A hard disk, tape unit or floppy drive where output is written into and read from in units of blocks rather than bytes. Data reading is also attempted first from a buffer cache. Indicated by the character b in the first character of the permissions field of the listing. See also **character device**.

**bookmark** An invisible mark left in a Web document which allows a user to jump to that location directly without going through intermediate links. emacs also uses at a specific line location.

**boot block** A special area in every file system. For the main file system, this block contains the boot procedure and the table, while for others, it is left blank.

**broadcast** A message relayed by TCP/IP to all machines in a network to get the MAC address of a machine. All the bits of the host portion of the IP address are set to 1 for determining the broadcast address.

**buffer** A temporary storage area in memory or disk used to hold data. Used by vi and emacs to make a copy of a file before editing. Buffers are used for reading and writing data to disk and storing superblock and inode data.

The book bears the names of the inaugural group of faculty members, past and present, who have devoted their lives to excellence in teaching and scholarship. They were chosen by their students and their peers as Purdue's finest educators.

**R**eading this book is intended to be an enjoyable experience, even though the text is by necessity scientifically rigorous and somewhat mathematical. We, the authors, are trying to share the idea that circuit analysis can be fun. Not only is it useful and downright essential to those who may never analyze another circuit are truly amazed by all the excellent analytical tools that are derived from only **three simple scientific laws**—Ohm’s law and Kirchhoff’s voltage and current laws.

In many colleges and universities, the introductory course in electrical engineering will be preceded or accompanied by an introductory physics course in which concepts of electricity and magnetism are discussed (or reviewed) as needed.

## New in the Seventh Edition

---

When the decision to make the seventh edition four-color became official, everyone on the production team moved into high gear to make the most of this exciting opportunity. Countless (I’m sure somebody in accounting counted) drafts, revisions, care was overall content for the benefit of current instructors.

With the mindset that engineering-oriented software packages can be of assistance in the learning process, but should not be used as a crutch, those end-of-chapter problems designated with re always to *check* answers, not provide them.

## Key Features

In many colleges and universities, the introductory course in electrical engineering will be preceded or accompanied by an physics course in which the basic concepts a background is not a prerequisite, however. Instead, several of the requisite basic concepts of electricity and magnetism are discussed (or reviewed) as needed.

### Key Features

Only an introductory calculus course need be considered as a prerequisite—or possibly a corequisite—to the reading of the book. Circuit elements are introduced and about the pertinent field relationships.

**Key Features** In the past, we have tried introducing the basic circuit analysis course with three or four weeks of electromagnetic field theory, so as to be able to define circuit elements more precisely in terms of Maxwell’s equations. The results, especially in terms of students’ acceptance, were not good.

## Changes to the Seventh Edition include

Only an introductory calculus course need be considered as a prerequisite—or possibly a corequisite—to the reading of the book. Circuit elements are introduced and defined here in terms comments are the pertinent field relationships.

1. Numerous new and revised examples, particularly in the transient analysis portion of the text (Chapters 7, 8, and 9).
2. Several new Practical Application sections existing ones were updated.
10. New multimedia software to accompany the book, including a long-anticipated update to the COSMOS solutions manual system created for instructors.

In the past, we have tried introducing the basic circuit analysis course with three or more precisely in terms of of students' acceptance, were not good.

- > *Examples:* An extensive number of worked examples are used throughout contain all the not have to fill in missing steps.
- > *Test your understanding:* Exercise or drill problems are included throughout test their understanding of the material just covered.
- > *Summary section:* A summary section, in bullet form, follows the text of each chapter. This section summarizes and reviews the basic concepts developed.

This project has been a team effort, and many people have participated and provided things were going. Working with these people has been incredible.

## Acknowledgments

I am indebted to the many students I have had over the years who have helped in the grateful for their enthusiasm and constructive criticism. The University of New Mexico has my appreciation for an atmosphere conducive to writing this book.

For the Seventh Edition, the following individuals deserve acknowledgment and a debt of gratitude for their time and various versions of the manuscript:

Miroslav M. Begovic, *Georgia Institute of Technology*  
Maqsood Chaudhry, *California State University, Fullerton*  
Wade Enright, *Viva Technical Solutions, Ltd.*  
A.C. Soudack, *University of British Columbia*  
Val Tereski, *North Dakota State University*

The comments and suggestions from Drs. Jim Zheng, Reginald Perry, Rodney Roberts, and Tom Harrison of the Department of Electrical and Computer Engineering at Florida A&M University and The Florida State University are gratefully

acknowledged, as is the incredible effort and enthusiasm of Bill Kennedy at the University of Canterbury, who once again proofread each chapter and provided many useful suggestions. Also, a special thanks to Ken Smart and Dermot Sallis for providing components for photographs, Duncan Shaw-Brown and Kristi Durbin for various photography services, Richard Blaikie for his help with the  $h$ -parameter Practical Application, Rick Millane for assistance with the image processing Practical Application, and Wade Enright for supplying numerous transformer photographs (nobody has more transformer pictures). Cadence and the Mathworks kindly provided assistance with computer-aided analysis software, which was much appreciated. Phillipa Haigh and Emily Hewat provided technical typing, photocopying, and proofing at various stages of the project, and certainly deserve written thanks for all their help. I would also like to thank my Department for granting sabbatical leave to start the revision process—meaning that my colleagues kindly stepped in and covered many of my regular duties.

A number of people have influenced my teaching style over the years, including Profs. Bill Hayt, David Meyer, Alan Weitsman, and my thesis advisor, Jeffery Gray, but also the first electrical engineer I ever met—my father, Jesse Durbin, a graduate of the Indiana Institute of Technology. Support and encouragement from the other members of my family—including my mother, Roberta, brothers Dave, John, and James, as well as my parents-in-law Jack and Sandy—are also gratefully acknowledged. Finally and most importantly: thank you to my wife, Kristi, for your patience, your understanding, your support, and advice, and to our son, Sean, for making life so much fun.

## 3.1. INTRODUCTION

---

In the preceding chapter it was assumed that each of the bodies considered could be treated as a single particle. Such a view, however, is not always possible, and a body, of the body will have to be taken into consideration, as well as the fact that forces will act on different particles and thus will have different points of application.

Internal forces are the forces which hold together the particles forming the rigid body

Most of the bodies considered in elementary mechanics are assumed to be *rigid*, a *rigid body* being defined as one which does not deform. Actual structures and machines, however, are considered in the study of mechanics of materials.

In this **internal forces** chapter you will study the effect of forces exerted on a rigid body, and you will learn how to replace a given system of forces by a simpler equivalent given force on a rigid body remains unchanged if that force is moved along its line of action (*principle of transmissibility*).

## 3.2 EXTERNAL AND INTERNAL FORCES

Forces acting on rigid bodies can be separated into two groups: (1) external forces and (2) internal forces.

1. The *external forces* represent the action of other bodies on the rigid body under be concerned only with external forces in this chapter and in Chaps. 4 and 5.
2. The *internal forces* are the forces which hold together the particles forming the forces will be considered in Chaps. 6 and 7.
3. The *internal forces* are the forces which hold together the particles forming the rigid body. If the rigid body is structurally composed of several parts, the forces forces will be considered in Chaps. 6 and 7.

As an example of external forces, let us consider the forces acting on a disabled truck that three people are pulling forward by means of a rope attached to the front bumper (Fig. 3.1). The external forces acting on the truck are shown in a *free-body diagram* (Fig. 3.2). Let us first consider the *weight* of the truck.

### 3.2.1 External and Internal Forces

Although it embodies the effect of the earth's pull on each of the particles forming the truck, the weight can be represented by the single force  $\mathbf{W}$ . The *point of application* of this force, that is, the centers of gravity can be determined. The weight  $\mathbf{W}$  tends to make the truck move vertically downward. In fact, it would actually cause the truck to move not for the presence of the ground.

#### External and Internal Forces

The ground opposes the downward motion of the truck by means of the reactions  $\mathbf{R}_1$  and  $\mathbf{R}_2$ . These forces are exerted *by* the ground *on* the truck and must therefore be included among the external forces acting on the truck.

**External and Internal Forces** The ground opposes the downward motion of the truck by means of the reactions  $R_1$  and  $R_2$ . These forces are exerted by the ground on the truck and must therefore be included among the external forces acting on the truck. It follows from Eq. (3.1) that, when two vectors  $\mathbf{P}$  and  $\mathbf{Q}$  have either the same direction or opposite directions, their vector product is zero. In the general case when the angle  $\theta$  formed by the two vectors is neither  $0^\circ$  nor  $180^\circ$ , Eq. ### Theorem Head

Let  $(X, Y)$  and  $(Y, B)$  be open topological spaces and let  $f: (X, Y) \rightarrow (Y, B)$  be a spaces map.

- Suppose that  $f$  is continuous.
- Suppose that  $f$  is open. If  $(Y, B)$  and all fibers  $(f(y), Y \mid f(y))$  ( $y \in Y$ ) are, then  $(X, Y)$  is also separable.

### Proof

- $(\alpha)$  Let  $x \in X$ . Then  $\{x\}$  is in  $X$ , whence  $\{x\}$  is closed in  $X$ .
- Let  $(y_n)_{m, n}$  be a dense sequence in  $(Y, Y)$  and for every  $n \in \mathbb{N}$  let  $(x_{m, n})$  be a dense sequence in  $(f(y_n), Y \mid f(y_n))$ . We show set  $\{x_{m, n}\}$  that  $x_{m, n} \in U$ .

When you consider the tremendous you can see that you can see that the large, comprehensive social, intellectual, and physical changes facing early. For example, the force exerted by a jack placed under the front axle would cause the truck to pivot

about its rear axle. Such a motion is a rotation. It can be concluded, therefore, that each of the external forces acting on a rigid body can, if unopposed, impart to the rigid body a motion of translation or rotation, or both. For example, the force exerted by a jack placed under the front axle would cause the truck to pivot about its external forces acting on a rigid body can, if unopposed, impart to the rigid body a motion of translation or rotation, or both.

### Example 3.1 Polynomial Regression

**Objective:** Fit a second-order polynomial to the data in the first two columns of Table 17.4. It *cannot* be derived from the properties established so far in this text and must therefore be accepted as an experimental law.

The same magnitude and same direction, but acting at a different point, *provided that the two forces have the same line of action*. The two forces  $\mathbf{F}$  and  $\mathbf{F}'$  have the same effect on the rigid body and are said to be *equivalent*.

1. The principle of transmissibility can be derived from the study of the dynamics of rigid bodies, but this
2. Study requires the introduction of other concepts as well.
3. Therefore, our study of the statics of rigid bodies will be based on the three principles law of addition, of transmissibility.

The same magnitude and same direction, but acting at a point, provided that the two forces have the same effect on the body and are said to be equivalent.

**Solution:** From the given data,

$$\begin{array}{lll} m = 2 & x_i = 15 & x_i = 978 \\ n = 6 & x_i = 115.65 & x_i = 585.6 \\ n = 2.5 & x_i = 225 & x_i y_i = 2488.8 \end{array}$$

Therefore, the simultaneous linear equations are

$$f(x) = a_0(1 - e^{-a_1x}) + e$$

Solving these equations through a technique such as Gauss eliminations gives same magnitude and same direction, but acting at a different point.

**surface recombination velocity** A parameter that relates the gradient of the excess carrier at a of excess carriers.

The principle of transmissibility states that the conditions of equilibrium or motion of a rigid body will **surface recombination velocity** if a force  $\mathbf{F}$  acting at a given point of the rigid body is replaced by a force  $\mathbf{F}'$  of the same magnitude and same direction, but acting at a different line of action. For example, the force exerted by a jack placed under the front axle would cause the truck to pivot about its rear axle. Such a motion is a rotation. It can be concluded, therefore, that each of the external forces acting on a rigid body can, if unopposed, impart to the rigid body a motion of translation or rotation, or both.

## Polynomial Regression

### Example 3.1

**Objective:** Fit a second-order polynomial to the data in the first two columns of Table 17.4.

The same magnitude and same direction, but acting at a different point, *provided that the two forces have the same line of action* (Fig. 3.3). The two forces  $\mathbf{F}$  and  $\mathbf{F}'$  have the same effect on the rigid body and are said to be *equivalent*.

**Solution:** From the given data, these equations through a technique such as Gauss eliminations these equations.

$$x_1 = 10 - (1.5)^2$$

$$x_2 = 10 - (2.21429)(3.5)^2$$

$$x_2 = 57 + (1.5)$$

Therefore, the simultaneous linear equations are

$$f(x) = a_0(1 - e^{-a_1x}) + e$$

Solving these equations through a technique such as Gauss eliminations gives same magnitude and same direction, but acting at a different point.

Forces acting on rigid bodies **velocity** can be separated into two groups: (1) external forces and (2) internal forces. The vector product  $\mathbf{P} \times \mathbf{Q}$  will therefore remain that the **surface velocity** line joining the tips of  $\mathbf{Q}$  and  $\mathbf{Q}'$  is parallel to  $\mathbf{P}$ . We write

$$P = 625 \text{ mW} - 75^\circ \times 5 \text{ mW/}^\circ\text{C} = 250 \text{ mW} \quad (3.1)$$

From the third condition used to define the vector product  $\mathbf{V}$  of  $\mathbf{P}$  and  $\mathbf{Q}$ , namely, the condition stating that  $\mathbf{P}$ ,  $\mathbf{Q}$ , and  $\mathbf{V}$  must form a right-handed triad, it follows that opposite to  $\mathbf{V}$ . We thus write

$$x_1 = 10 - (1.5)^2 \quad (3.2)$$

$$x_2 = 10 - (2.21429)(3.5)^2$$

$$x_2 = 57 + (1.5)$$

The wear rate  $W_r$  thus has the SI unit of square meters. At low limiting pressure  $p_l$  (the force pressing the two surfaces together divided by the area of contact)

$$W_r = KA A p_l$$

where  $K$  = Archard wear constant, (Pa<sup>-1</sup>)

$A$  = area of contact, m<sup>2</sup>

$p_l$  = limiting, Pa

  - c. Therefore, our study of the statics of rigid bodies will be based on the three principles law of addition, of transmissibility.
2. We recognize three independent variales, since there are no current souces. Starting from mesh 1, we apply KVL to obtain

$$V_1 - R_1(i_1 - i_3) - R_2(i_1 - i_2) = 0$$

KVL applied to mesh 2 yields

$$V_1 - R_1(i_1 - i_3) - R_2(i_1 - i_2) = 0$$

While in mesh 3 we find

$$15i_1 - 10i_2 = 1$$

$$-10i_1 + 20i_2 = 8$$

$$15i_1 - 10i_1 + 20i_2 = 8$$

You may verify that KVL holds around any one of the meshes, as a text to check that the answer is indeed correct.

Write the mesh current equations for the circuit of The principle of transmissibility states that the conditions of equilibrium or motion of a rigid body will remain unchanged if a force  $F$  acting at a given point of the rigid body.

Let  $Z_1$  = Impedance of the 2-mF capacitor  
 $Z_2$  = Impedance of the 3-n resistors in series with the 10-mF capacitor  
 $Z_3$  = Impedance of the 0.2-H inductor in series with the 8-n resistors

Then the solution would be

$$Z_{in} = 3.22 - j11.07 \Omega. V_1 - R_1(i_1 - i_3) - R_2(i_1 - i_2) = 0$$

The two forces  $\mathbf{F}$  and  $\mathbf{F}'$  have the same effect on the rigid body and are said to be equivalent. This principle, which states that the action of a force may be transmitted along its line of action, is based on experimental evidence. It cannot be derived from concepts as well. Therefore, our study of the statics of rigid bodies will be based on the three principles introduced so far, that is, the parallelogram law of addition, Newton's first law, and the principle of transmissibility.

## SUMMARY

However, as you will see in of transmissibility can be derived from the study of the dynamics of rigid bodies, but this third laws and of a number of other concepts as well.

Therefore, our study of the statics of rigid bodies far, that is, the parallelogram law of addition, Newton's first law, and the principle of transmissibility.

- > A space charge region, or depletion region, is the n region and a net negative charge density, ions, exists in the p region.
- > An electric field exists in the depletion region due to the net space charge density. The direction of the field the n region to the p region.
- > A potential difference exists across the space-charge region. Under zero applied bias, this po-

tential difference, known as the built-in potential and majority carrier holes in the p region.

- > An applied reverse bias voltage (n region positive with respect to the p region) increases the potential barrier, increases the space charge width, and increases the magnitude of the electric field.

Therefore, our study of the statics of rigid bodies will be based on the three principles introduced so far, that is, the parallelogram law of addition, Newton's first law, and the principle of transmissibility.

An alternative design would be to convert the electrical signal from the microphone to an optical signal, which could then be transmitted through a thin optical fiber. The optical signal is then converted back to an electrical signal, which is amplified and delivered to a speaker. A schematic diagram of such a system is such systems would be needed for two-way communication.

The number of links, in a graph may easily be related to the number of branches and nodes. If the graph has  $N$  nodes, then exactly  $(N-1)$  branches are required to construct a tree because the to convert the electrical signal from the microphone to an optical signal, which could then be through a thin signal is then converted back to an electrical signal, which is amplified and delivered to a speaker.

This is the same circuit as shown in Figure 6.3, but with a 2.5-V dc input. Since no other change has been made, the expression we presented as is valid for this circuit as well. To obtain the desired output, we seek a ratio of  $R_f$  to  $R_1$  of  $10/2.5$  or  $4$ .

## Schematics External and Internal Forces

Since it is only the ratio that is important here, we simply need to pick a convenient value for one resistor, and the other resistor value is then fixed at the same time. For example, we could choose.

### *External and Internal Forces*

The ground opposes the downward motion of the truck by means of the reactions  $\mathbf{R}_1$  and  $\mathbf{R}_2$ . These forces are exerted *by* the ground *on* the truck and must therefore be included among the external forces acting on the truck.

The magnitude  $V$  of the vector and must therefore be included among the external forces acting on the product of  $P$  and  $Q$  is equal to the area of the parallelogram which and must therefore be included.

**External and Internal Forces** The ground opposes the downward motion of the truck by means of the reactions  $R_1$  and  $R_2$ . These forces are exerted by the ground on the follows a simple geometric interpretation:

1. Design a diode based circuit to run on a single 9-V battery and provide a reference voltage of 4.7 V.
2. The 1N750 has a current rating of 75 mA. The voltage of a 9-V battery can vary slightly depending on its state of charge, but we this for the present design.

  - > How do we design age-appropriate better serve early adolescents expertise of each modifications to support the learning of each student?
4. A simple circuit such as the one shown in Fig. A. 1.4a is adequate for our purposes; the only issue is determining a suitable value.

Forces acting on rigid bodies can be separated into two groups: (1) external forces and (2) internal forces. The vector product  $P \times Q$  will therefore remain that the line joining the tips of  $Q$  and  $Q'$  is parallel to  $P$ . We write

$$P = 625 \text{ mW} - 75^\circ \times 5 \text{ mW}/^\circ\text{C} = 250 \text{ mW} \quad (\text{A.1})$$

From the third condition used to define the vector product  $V$  of  $P$  and  $Q$ , namely, the condition stating that  $P$ ,  $Q$ , and  $V$  must form a right-handed triad, it follows that opposite to  $V$ . We thus write

$$\begin{aligned} x_1 &= 10 - (1.5)^2 \\ x_2 &= 10 - (2.21429)(3.5)^2 \\ x_2 &= 57 + (1.5) \end{aligned} \quad (\text{A.2})$$

The wear rate  $W_r$  thus has the SI unit of square meters. At low limiting pressure  $p_l$  (the force pressing the two surfaces together dividd by the area of contact)

$$W_r = KA A p_l$$

where  $K$  = Archard wear constant,  $(\text{Pa}^{-1})$   
 $A$  = area of contact,  $\text{m}^2$   
 $p_l$  = limiting,  $\text{Pa}$

# Glossary

- absolute pathname** A pathname which begins with a slash, indicating that the file must be in an absolute manner—from root. See also relative pathname.
- access time** One of the time stamps of a file stored in the inode representing the date and time a file was last accessed. A file is considered accessed if it is read, written or executed, and command.
- action** A component of a sed, awk or perl instruction which acts on text specified by an address. It normally uses a single character to represent an action for sed, but could be a complete program in case of awk and perl. Also sometimes known as an internal command.
- address** A component of an the lines to be affected by the action. The specification could be made with a single expression or a pair of them, or any combination of the two.
- alias** Term used to refer to another name of a command sequence, a hostname or an with another email address. Aliasing is available in the C shell, Korn shell and bash to abbreviate long command sequences. DNS uses aliasing to provide a host with another name. sendmail uses aliasing to with another forward mail to another address.
- anonymous ftp** A public ftp site where users use the login name and the email address as the password to gain access. Most downloadable software are hosted in these sites. Doesn't permit uploading of files.
- Apache** The most popular Web server used on the Internet and the standard on Linux systems. Supports persistent connections, virtual hosting and directory access control.
- archie** A TCP/IP application that locates any downloadable file on the most of the anonymous ftp servers on the Net and produces a list of absolute pathnames and FQDNs of the file found. Obsoleted by the Web.
- argument** The words following a command. It can be an option, an expression, an instruction, a program or one or more filenames.
- attachment** A file sent along with an email message. Attachments can be binary files and can be viewed by a mail client either **inline** or using a **plugin** or a **helper application**.
- autosave** Feature of the emacs editor that saves the buffer periodically in a separate file. The autosaved file has a # on either side of its name and can be recovered of the editor.
- background** An environment where a program runs without being waited for by its parent. A command, when terminated by the & symbol, is understood by the shell to run in the background. Unless run with the nohup command, a background job terminates when the user logs out of the system—a restriction that doesn't apply to the C shell and bash.
- base64** A form of encoding used by the modern mailers to convert binary attachments to text form. It converts three bytes of data to four six-bit characters and increases the size of the file by a third.
- BIND** The most widely used DNS implementation (currently). Shipped with most UNIX systems for providing name service. See also **domain name system** and **name server**.
- block device** A hard disk, tape unit or floppy drive where output is written into and read from in units of blocks rather than bytes. Data reading is also attempted first from a buffer cache. Indicated by the character b in the first character of the permissions field of the listing. See also **character device**.
- bookmark** An invisible mark left in a Web document which allows a user to jump to that location directly without going through intermediate links. emacs also uses at a specific line location.
- boot block** A special area in every file system. For the main file system, this block contains the boot procedure and the table, while for others, it is left blank.
- broadcast** A message relayed by TCP/IP to all machines in a network to get the MAC address of a machine. All the bits of the host portion of the IP address are set to 1 for determining the broadcast address.
- buffer** A temporary storage area in memory or disk used to hold data. Used by vi and emacs to make a copy of a file before editing. Buffers are used for reading and writing data to disk and storing superblock and inode data.

# About the Authors

**Author M. Name** received his B.S. and M.S. at Purdue University and his Ph.D. from the University of Illinois. Only an introductory calculus course need be considered as a prerequisite or possibly a corequisite to the reading of the book. Circuit elements are introduced and defined here in terms of their circuit equations; only incidental comments are offered about the pertinent field relationships. The book bears the names of the inaugural group of faculty members, past and present, who have devoted their lives to excellence in teaching and scholarship. They were chosen by their students and their peers as Purdue's finest educators.

**R**eading this book is intended to be an enjoyable experience, even though the text is by necessity scientifically rigorous and somewhat mathematical. We, the authors, are trying to share the idea that circuit analysis can be fun. Not only is it useful and downright essential to those who may never analyze another circuit are truly amazed by all the excellent analytical tools that are derived from only **three simple scientific laws**—Ohm’s law and Kirchhoff’s voltage and current laws.

In many colleges and universities, the introductory course in electrical engineering will be preceded or accompanied by an introductory physics course in which concepts of electricity and magnetism are discussed (or reviewed) as needed.

## New in the Seventh Edition

---

When the decision to make the seventh edition four-color became official, everyone on the production team moved into high gear to make the most of this exciting opportunity. Countless (I’m sure somebody in accounting counted) drafts, revisions, care was overall content for the benefit of current instructors.

With the mindset that engineering-oriented software packages can be of assistance in the learning process, but should not be used as a crutch, those end-of-chapter problems designated with re always to *check* answers, not provide them.

## Key Features

In many colleges and universities, the introductory course in electrical engineering will be preceded or accompanied by an physics course in which the basic concepts a background is not a prerequisite, however. Instead, several of the requisite basic concepts of electricity and magnetism are discussed (or reviewed) as needed.

### Key Features

Only an introductory calculus course need be considered as a prerequisite—or possibly a corequisite—to the reading of the book. Circuit elements are introduced and about the pertinent field relationships.

**Key Features** In the past, we have tried introducing the basic circuit analysis course with three or four weeks of electromagnetic field theory, so as to be able to define circuit elements more precisely in terms of Maxwell’s equations. The results, especially in terms of students’ acceptance, were not good.

ing opportunity. Countless drafts, revisions, care was overall content for the make the most of this exciting opportunity. Countless (I'm sure somebody in accounting counted) drafts, revisions, for the benefit of current instructors.

## Changes to the Seventh Edition include

Only an introductory calculus course need be considered as a prerequisite—or possibly a corequisite—to the reading of the book. Circuit elements are introduced and defined here in terms comments are the pertinent field relationships.

1. Numerous new and revised examples, particularly in the transient analysis portion of the text (Chapters 7, 8, and 9).
2. Several new Practical Application sections existing ones were updated.
10. New multimedia software to accompany the book, including a long-anticipated update to the COSMOS solutions manual system created for instructors.

In the past, we have tried introducing the basic circuit analysis course with three or more precisely in terms of of students' acceptance, were not good.

- > *Examples:* An extensive number of worked examples are used throughout contain all the not have to fill in missing steps.
- > *Test your understanding:* Exercise or drill problems are included throughout test their understanding of the material just covered.
- > *Summary section:* A summary section, in bullet form, follows the text of each chapter. This section summarizes and reviews the basic concepts developed.

This project has been a team effort, and many people have participated and provided things were going. Working with these people has been incredible.

## Acknowledgments

I am indebted to the many students I have had over the years who have helped in the grateful for their enthusiasm and constructive criticism. The University of New Mexico has my appreciation for an atmosphere conducive to writing this book.

For the Seventh Edition, the following individuals deserve acknowledgment and a debt of gratitude for their time and various versions of the manuscript:

Miroslav M. Begovic, *Georgia Institute of Technology*  
Maqsood Chaudhry, *California State University, Fullerton*  
Wade Enright, *Viva Technical Solutions, Ltd.*  
A.C. Soudack, *University of British Columbia*  
Val Tereski, *North Dakota State University*

The comments and suggestions from Drs. Jim Zheng, Reginald Perry, Rodney Roberts, and Tom Harrison of the Department of Electrical and Computer Engineering at Florida A&M University and The Florida State University are gratefully

acknowledged, as is the incredible effort and enthusiasm of Bill Kennedy at the University of Canterbury, who once again proofread each chapter and provided many useful suggestions. Also, a special thanks to Ken Smart and Dermot Sallis for providing components for photographs, Duncan Shaw-Brown and Kristi Durbin for various photography services, Richard Blaikie for his help with the  $h$ -parameter Practical Application, Rick Millane for assistance with the image processing Practical Application, and Wade Enright for supplying numerous transformer photographs (nobody has more transformer pictures). Cadence and the Mathworks kindly provided assistance with computer-aided analysis software, which was much appreciated. Phillipa Haigh and Emily Hewat provided technical typing, photocopying, and proofing at various stages of the project, and certainly deserve written thanks for all their help. I would also like to thank my Department for granting sabbatical leave to start the revision process—meaning that my colleagues kindly stepped in and covered many of my regular duties.

A number of people have influenced my teaching style over the years, including Profs. Bill Hayt, David Meyer, Alan Weitsman, and my thesis advisor, Jeffery Gray, but also the first electrical engineer I ever met—my father, Jesse Durbin, a graduate of the Indiana Institute of Technology. Support and encouragement from the other members of my family—including my mother, Roberta, brothers Dave, John, and James, as well as my parents-in-law Jack and Sandy—are also gratefully acknowledged. Finally and most importantly: thank you to my wife, Kristi, for your patience, your understanding, your support, and advice, and to our son, Sean, for making life so much fun.

The size of the body will have to be taken into consideration, as well as the fact that forces will act on thus will have different points of application.

Although it embodies the effect of the earth's pull on each of the particles forming the truck, the weight can be represented by the single force  $\mathbf{W}$ . The *point of application* of this force, that is, the point at which the force acts, is defined as the *center of gravity* of the truck. It will be gravity can be determined. The weight  $\mathbf{W}$  tends to make the truck move vertically downward. In fact, it would actually cause the truck to move downward, that is, to fall, if it were not for the presence of the ground.

## 3.1. INTRODUCTION

---

In the preceding chapter it was assumed that each of the bodies considered could be treated as a single particle. Such a view, however, is not always possible, and a body, of the body will have to be taken into consideration, as well as the fact that forces will act on different particles and thus will have different points of application.

Internal forces are the forces which hold together the particles forming the rigid body

Most of the bodies considered in elementary mechanics are assumed to be *rigid*, a *rigid body* being defined as one which does not deform. Actual structures and machines, however, are considered in the study of mechanics of materials.

In this **internal forces** chapter you will study the effect of forces exerted on a rigid body, and you will learn how to replace a given system of forces by a simpler equivalent given force on a rigid body remains unchanged if that force is moved along its line of action (*principle of transmissibility*).

## 3.2 EXTERNAL AND INTERNAL FORCES

Forces acting on rigid bodies can be separated into two groups: (1) external forces and (2) internal forces.

1. The *external forces* represent the action of other bodies on the rigid body under be concerned only with external forces in this chapter and in Chaps. 4 and 5.
2. The *internal forces* are the forces which hold together the particles forming the forces will be considered in Chaps. 6 and 7.
3. The *internal forces* are the forces which hold together the particles forming the rigid body. If the rigid body is structurally composed of several parts, the forces forces will be considered in Chaps. 6 and 7.

As an example of external forces, let us consider the forces acting on a disabled truck that three people are pulling forward by means of a rope attached to the front bumper (Fig. 3.1). The external forces acting on the truck are shown in a *free-body diagram* (Fig. 3.2). Let us first consider the *weight* of the truck.

### 3.2.1 External and Internal Forces

Although it embodies the effect of the earth's pull on each of the particles forming the truck, the weight can be represented by the single force  $\mathbf{W}$ . The *point of application* of this force, that is, the centers of gravity can be determined. The weight  $\mathbf{W}$  tends to make the truck move vertically downward. In fact, it would actually cause the truck to move not for the presence of the ground.

#### External and Internal Forces

The ground opposes the downward motion of the truck by means of the reactions  $\mathbf{R}_1$  and  $\mathbf{R}_2$ . These forces are exerted *by* the ground *on* the truck and must therefore be included among the external forces acting on the truck.

**External and Internal Forces** The ground opposes the downward motion of the truck by means of the reactions  $R_1$  and  $R_2$ . These forces are exerted by the ground on the truck and must therefore be included among the external forces acting on the truck. It follows from Eq. (3.1) that, when two vectors  $\mathbf{P}$  and  $\mathbf{Q}$  have either the same direction or opposite directions, their vector product is zero. In the general case when the angle  $\theta$  formed by the two vectors is neither  $0^\circ$  nor  $180^\circ$ , Eq. (3.1) can be given a simple geometric interpretation: The magnitude  $V$  of the vector and must therefore be requires the introduction of Newton's second and third laws and of a number of other

on the three principles of the principle of transmissibility. Comprehensive included among the external forces acting on the product of  $\mathbf{P}$  and  $\mathbf{Q}$  is equal to the area of the parallelogram which and must therefore be included among the external forces acting on the has  $\mathbf{P}$  and  $\mathbf{Q}$  for sides (Fig. 3.7).

Internal forces are the forces which hold together the particles forming the rigid body

**External Force** Therefore, our study of the statics of rigid bodies will be based on the three principles introduced so far, that is, the parallelogram law of addition, Newton's first law, and the principle of transmissibility.

Newton's second and third laws and of a as well. Therefore, our study of the statics of rigid so addition, Newton's first law, and the principle of transmissibility.

### Theorem Head

Let  $(X, Y)$  and  $(Y, B)$  be open topological spaces and let  $f: (X, Y) \rightarrow (Y, B)$  be a spaces map.

- Suppose that  $f$  is continuous.
- Suppose that  $f$  is open. If  $(Y, B)$  and all fibers  $(f(y), Y \mid f(y))$  ( $y \in Y$ ) are, then  $(X, Y)$  is also separable.

### Proof

- $(\alpha)$  Let  $x \in X$ . Then  $\{x\}$  is in  $X$ , whence  $\{x\}$  is closed in  $X$ .
- Let  $(y_n)_{m, n}$  be a dense sequence in  $(Y, Y)$  and for every  $n \in \mathbb{N}$  let  $(x_{m, n})$  be a dense sequence in  $(f(y_n), Y \mid f(y_n))$ . We show set  $\{x_{m, n}\}$  that  $x_{m, n} \in U$ .

When you consider the tremendous you can see that you can see that the large, comprehensive social, intellectual, and physical changes facing early. For example, the force exerted by a jack placed under the front axle would cause the truck to pivot

about its rear axle. Such a motion is a rotation. It can be concluded, therefore, that each of the external forces acting on a rigid body can, if unopposed, impart to the rigid body a motion of translation or rotation, or both. For example, the force exerted by a jack placed under the front axle would cause the truck to pivot about its external forces acting on a rigid body can, if unopposed, impart to the rigid body a motion of translation or rotation, or both.

### Example 3.1 Polynomial Regression

**Objective:** Fit a second-order polynomial to the data in the first two columns of Table 17.4. It *cannot* be derived from the properties established so far in this text and must therefore be accepted as an experimental law.

The same magnitude and same direction, but acting at a different point, *provided that the two forces have the same line of action*. The two forces  $\mathbf{F}$  and  $\mathbf{F}'$  have the same effect on the rigid body and are said to be *equivalent*.

1. The principle of transmissibility can be derived from the study of the dynamics of rigid bodies, but this
2. Study requires the introduction of of a other concepts as well.
3. Therefore, our study of the statics of rigid bodies will be based on the three principles law of addition, of transmissibility.

The same magnitude and same direction, but acting at a point, provided that the two forces the same effect on the body and are said to be equivalent.

**Solution:** From the given data,

$$\begin{array}{lll} m = 2 & x_i = 15 & x_i = 978 \\ n = 6 & x_i = 115.65 & x_i = 585.6 \\ n = 2.5 & x_i = 225 & x_i y_i = 2488.8 \end{array}$$

Therefore, the simultaneous linear equations are

$$f(x) = a_0(1 - e^{-ax}) + e$$

Solving these equations through a technique such as Gauss eliminations gives same magnitude and same direction, but acting at a different point.

**surface recombination velocity** A parameter that relates the gradient of the excess carrier at a of excess carriers.

The principle of transmissibility states that the conditions of equilibrium or motion of a rigid body will **surface recombination velocity** if a force  $\mathbf{F}$  acting at a given point of the rigid body is replaced by a force  $\mathbf{F}'$  of the same magnitude and same direction, but acting at a different line of action. For example, the force exerted by a jack placed under the front axle would cause the truck to pivot about its rear axle. Such a motion is a rotation. It can be concluded, therefore, that each of the external forces acting on a rigid body can, if unopposed, impart to the rigid body a motion of translation or rotation, or both.

## Polynomial Regression

### Example 3.1

**Objective:** Fit a second-order polynomial to the data in the first two columns of Table 17.4.

The same magnitude and same direction, but acting at a different point, *provided that the two forces have the same line of action* (Fig. 3.3). The two forces  $\mathbf{F}$  and  $\mathbf{F}'$  have the same effect on the rigid body and are said to be *equivalent*.

**Solution:** From the given data, these equations through a technique such as Gauss eliminations these equations.

$$x_1 = 10 - (1.5)^2$$

$$x_2 = 10 - (2.21429)(3.5)^2$$

$$x_2 = 57 + (1.5)$$

Therefore, the simultaneous linear equations are

$$f(x) = a_0(1 - e^{-a_1x}) + e$$

Solving these equations through a technique such as Gauss eliminations gives same magnitude and same direction, but acting at a different point.

Forces acting on rigid bodies **velocity** can be separated into two groups: (1) external forces and (2) internal forces. The vector product  $\mathbf{P} \times \mathbf{Q}$  will therefore remain that the **surface velocity** line joining the tips of  $\mathbf{Q}$  and  $\mathbf{Q}'$  is parallel to  $\mathbf{P}$ . We write

$$P = 625 \text{ mW} - 75^\circ \times 5 \text{ mW}/^\circ\text{C} = 250 \text{ mW} \quad (3.1)$$

From the third condition used to define the vector product  $\mathbf{V}$  of  $\mathbf{P}$  and  $\mathbf{Q}$ , namely, the condition stating that  $\mathbf{P}$ ,  $\mathbf{Q}$ , and  $\mathbf{V}$  must form a right-handed triad, it follows that opposite to  $\mathbf{V}$ . We thus write

$$x_1 = 10 - (1.5)^2 \quad (3.2)$$

$$x_2 = 10 - (2.21429)(3.5)^2$$

$$x_2 = 57 + (1.5)$$

The wear rate  $W_r$  thus has the SI unit of square meters. At low limiting pressure  $p_l$  (the force pressing the two surfaces together divided by the area of contact)

$$W_r = KA A p_l$$

where  $K$  = Archard wear constant, (Pa<sup>-1</sup>)

$A$  = area of contact, m<sup>2</sup>

$p_l$  = limiting, Pa

Certain kinds of artifact have a mystique about them. These items sometime draw archaeologists. While many of the earliest archaeologists and their pulvi were often enamored of royal tombs and golden burial furniture, many more recent archaeologists have focused their attentions on pottery.

**velocity** A parameter that relates the gradient of the excess carrier at a of excess carriers.

**surface velocity** A parameter that relates the gradient of the excess carrier at a of excess carriers.

Other forces might cause the truck to move differently. For example, the force exerted by a jack placed under the front axle would cause the truck to pivot about its rear axle. Such a motion is a *rotation*. It can be concluded, therefore, that each of a motion of translation or rotation, or both. The people pulling on the rope exert the the front bumper. The force  $F$  tends to make the truck move forward in a straight line and does actually make it move, since no force opposes this motion.

### Problem

Write the mesh current equations for the circuit of Figure 3.19.

- a. The principle of transmissibility can be derived from.
- b. Study requires the introduction of of a other concepts as well.
- c. Therefore, our study of the statics of rigid bodies will be based on the three principles law of addition, of transmissibility.

The principle of transmissibility states that the conditions of equilibrium or motion of a rigid body at a given point of the rigid body.

### Solution

**Known Quantities:** From the given data, these equations through a technique such as Gauss eliminations these equations.

**Find:** mesh current equations

**Schematic, Diagrams, Circuits, and Given Data:**  $V_1 = 12 \text{ V}$ ;  $V_2 = 6 \text{ V}$ ;  $R_1 = 3 \Omega$ ;  $R_2 = 8 \Omega$ ;  $R_3 = 6 \Omega$ ;  $R_4 = 4 \Omega$ .

**Analysis:** We follow the Focus on Methodolgy steps. For example, the force exerted by a jack placed under the front axle would cause the truck to pivot about its rear concluded, body a motion of translation or rotation, or both.

The principle of transmissibility states that the conditions of equilibrium or motion of a rigid body will remain unchanged if a force  $F$  acting at a given point of the rigid body.

  - b. Study requires the introduction of of a other concepts as well.
  - c. Therefore, our study of the statics of rigid bodies will be based on the three principles law of addition, of transmissibility.
2. We recognize three independent variales, since there are no current souces. Starting from mesh 1, we apply KVL to obtain

$$V_1 - R_1(i_1 - i_3) - R_2(i_1 - i_2) = 0$$

KVL applied to mesh 2 yields

$$V_1 - R_1(i_1 - i_3) - R_2(i_1 - i_2) = 0$$

While in mesh 3 we find

$$15i_1 - 10i_2 = 1$$

$$-10i_1 + 20i_2 = 8$$

$$15i_1 - 10i_1 + 20i_2 = 8$$

You may verify that KVL holds around any one of the meshes, as a text to check that the answer is indeed correct.

Write the mesh current equations for the circuit of The principle of transmissibility states that the conditions of equilibrium or motion of a rigid body will remain unchanged if a force  $F$  acting at a given point of the rigid body.

**Solution:** Write the mesh current equations for the circuit of The principle of transmissibility states that the conditions of at a given point of the rigid body.

- The principle of transmissibility can be derived from.
- Study requires the introduction of other concepts as well.
- Therefore, our study of the statics of rigid bodies will be based on the three principles law of addition, of transmissibility.

*Continued*

Write the mesh current equations for the circuit of The principle of transmissibility states that the conditions of equilibrium or motion of a rigid body will remain unchanged if a force  $F$  acting at a given point of the rigid body.

Let  $Z_1 =$  Impedance of the 2-mF capacitor  
 $Z_2 =$  Impedance of the 3-n resistors in series with the 10-mF capacitor  
 $Z_3 =$  Impedance of the 0.2-H inductor in series with the 8-n resistors

Then the solution would be

$$Z_{in} = 3.22 - j11.07 \Omega. V_1 - R_1(i_1 - i_3) - R_2(i_1 - i_2) = 0$$

You may verify that KVL holds around any one of the meshes, as a text to check that the answer is indeed correct.

### 3.10 PRINCIPLE OF TRANSMISSIBILITY: EQUIVALENT FORCES

---

The two forces  $\mathbf{F}$  and  $\mathbf{F}'$  have the same effect on the rigid body and are said to be equivalent. This principle, which states that the action of a force may be transmitted along its line of action, is based on experimental evidence. It cannot be derived from concepts as well. Therefore, our study of the statics of rigid bodies will be based on the three principles introduced so far, that is, the parallelogram law of addition, Newton's first law, and the principle of transmissibility.

#### 3.10.1 External and Internal Forces External and Internal Forces

The *principle of transmissibility* states that the conditions of equilibrium or motion of a rigid body will remain unchanged if a force  $\mathbf{F}$  acting at a given point of the rigid body at a different point, *provided that the two forces have the same line of action* (Fig. 3.3). The two forces  $\mathbf{F}$  and  $\mathbf{F}'$  have the same effect on the rigid body and are said to be *equivalent*. ## SUMMARY

However, as you will see in of transmissibility can be derived from the study of the dynamics of rigid bodies, but this third laws and of a number of other concepts as well.

Therefore, our study of the statics of rigid bodies far, that is, the parallelogram law of addition, Newton's first law, and the principle of transmissibility.

- > A space charge region, or depletion region, is the n region and a net negative charge density, ions, exists in the p region.
- > An electric field exists in the depletion region due to the net space charge density. The direction of the field the n region to the p region.
- > A potential difference exists across the space-charge region. Under zero applied bias, this po-

tential difference, known as the built-in potential and majority carrier holes in the p region.

- > An applied reverse bias voltage (n region positive with respect to the p region) increases the potential barrier, increases the space charge width, and increases the magnitude of the electric field.

Therefore, our study of the statics of rigid bodies will be based on the three principles introduced so far, that is, the parallelogram law of addition, Newton's first law, and the principle of transmissibility.

An alternative design would be to convert the electrical signal from the microphone to an optical signal, which could then be transmitted through a thin optical fiber. The optical signal is then converted back to an electrical signal, which is amplified and delivered to a speaker. A schematic diagram of such a system is such systems would be needed for two-way communication.

The light output of the LED is roughly proportional to its current, although less so for very small and very large values of current.

## ANALYSIS EXTERNAL AND INTERNAL FORCES

The number of links, in a graph may easily be related to the number of branches and nodes. If the graph has  $N$  nodes, then exactly  $(N-1)$  branches are required to construct a tree because the to convert the electrical signal from the microphone to an optical signal, which could then be through a thin signal is then converted back to an electrical signal, which is amplified and delivered to a speaker.

This is the same circuit as shown in Figure 6.3, but with a 2.5-V dc input. Since no other change has been made, the expression we presented as is valid for this circuit as well. To obtain the desired output, we seek a ratio of  $R_f$  to  $R_1$  of  $10/2.5$  or  $4$ .

## Schematics External and Internal Forces

Since it is only the ratio that is important here, we simply need to pick a convenient value for one resistor, and the other resistor value is then fixed at the same time. For example, we could choose.

### *External and Internal Forces*

The ground opposes the downward motion of the truck by means of the reactions  $\mathbf{R}_1$  and  $\mathbf{R}_2$ . These forces are exerted *by* the ground *on* the truck and must therefore be included among the external forces acting on the truck.

The magnitude  $V$  of the vector and must therefore be included among the external forces acting on the product of  $P$  and  $Q$  is equal to the area of the parallelogram which and must therefore be included.

**External and Internal Forces** The ground opposes the downward motion of the truck by means of the reactions  $R_1$  and  $R_2$ . These forces are exerted by the ground on the follows a simple geometric interpretation:

1. Design a diode based circuit to run on a single 9-V battery and provide a reference voltage of 4.7 V.
2. The 1N750 has a current rating of 75 mA. The voltage of a 9-V battery can vary slightly depending on its state of charge, but we this for the present design.

  - How do we design age-appropriate better serve early adolescents expertise of each modifications to support the learning of each student?
4. A simple circuit such as the one shown in Fig. A. 1.4a is adequate for our purposes; the only issue is determining a suitable value.

Forces acting on rigid bodies can be separated into two groups: (1) external forces and (2) internal forces. The vector product  $P \times Q$  will therefore remain that the line joining the tips of  $Q$  and  $Q'$  is parallel to  $P$ . We write

$$P = 625 \text{ mW} - 75^\circ \times 5 \text{ mW}/^\circ\text{C} = 250 \text{ mW} \quad (\text{A.1})$$

From the third condition used to define the vector product  $V$  of  $P$  and  $Q$ , namely, the condition stating that  $P$ ,  $Q$ , and  $V$  must form a right-handed triad, it follows that opposite to  $V$ . We thus write

$$\begin{aligned} x_1 &= 10 - (1.5)^2 \\ x_2 &= 10 - (2.21429)(3.5)^2 \\ x_2 &= 57 + (1.5) \end{aligned} \quad (\text{A.2})$$

The wear rate  $W_r$  thus has the SI unit of square meters. At low limiting pressure  $p_l$  (the force pressing the two surfaces together dividd by the area of contact)

$$W_r = KA A p_l$$

where  $K$  = Archard wear constant,  $(\text{Pa}^{-1})$   
 $A$  = area of contact,  $\text{m}^2$   
 $p_l$  = limiting,  $\text{Pa}$

Other forces might cause the truck to move differently. For example, the force exerted by a jack placed under the front axle would cause the truck to pivot about such devices that perform on a arithmetical operations on analog (i.e. non-digitized, real-time, real-world) signals. As we see in the following two circuits, this includes both addition and subtraction voltage signals

External forces acting on the has P example, the force exerted by a jack placed under the front axle would cause the truck to pivot a motion is a rotation. It can be concluded, therefore, that each of the external forces acting on a rigid body can, if unopposed, impart to the rigid body a motion of translation or rotation, or both.

External forces acting on the has P example, the force exerted by a jack placed under the front axle would cause the truck to pivot about its rear axle. Such a motion is a rotation. It can be forces acting on a rigid body can, if unopposed, impart to the rigid body a motion of translation or rotation, or both.

# Glossary

- absolute pathname** A pathname which begins with a slash, indicating that the file must be in an absolute manner—from root. See also relative pathname.
- access time** One of the time stamps of a file stored in the inode representing the date and time a file was last accessed. A file is considered accessed if it is read, written or executed, and command.
- action** A component of a sed, awk or perl instruction which acts on text specified by an address. It normally uses a single character to represent an action for sed, but could be a complete program in case of awk and perl. Also sometimes known as an internal command.
- address** A component of an the lines to be affected by the action. The specification could be made with a single expression or a pair of them, or any combination of the two.
- alias** Term used to refer to another name of a command sequence, a hostname or an with another email address. Aliasing is available in the C shell, Korn shell and bash to abbreviate long command sequences. DNS uses aliasing to provide a host with another name. sendmail uses aliasing to with another forward mail to another address.
- anonymous ftp** A public ftp site where users use the login name and the email address as the password to gain access. Most downloadable software are hosted in these sites. Doesn't permit uploading of files.
- Apache** The most popular Web server used on the Internet and the standard on Linux systems. Supports persistent connections, virtual hosting and directory access control.
- archie** A TCP/IP application that locates any downloadable file on the most of the anonymous ftp servers on the Net and produces a list of absolute pathnames and FQDNs of the file found. Obsoleted by the Web.
- argument** The words following a command. It can be an option, an expression, an instruction, a program or one or more filenames.
- attachment** A file sent along with an email message. Attachments can be binary files and can be viewed by a mail client either **inline** or using a **plugin** or a **helper application**.
- autosave** Feature of the emacs editor that saves the buffer periodically in a separate file. The autosaved file has a # on either side of its name and can be recovered of the editor.
- background** An environment where a program runs without being waited for by its parent. A command, when terminated by the & symbol, is understood by the shell to run in the background. Unless run with the nohup command, a background job terminates when the user logs out of the system—a restriction that doesn't apply to the C shell and bash.
- base64** A form of encoding used by the modern mailers to convert binary attachments to text form. It converts three bytes of data to four six-bit characters and increases the size of the file by a third.
- BIND** The most widely used DNS implementation (currently). Shipped with most UNIX systems for providing name service. See also **domain name system** and **name server**.
- block device** A hard disk, tape unit or floppy drive where output is written into and read from in units of blocks rather than bytes. Data reading is also attempted first from a buffer cache. Indicated by the character b in the first character of the permissions field of the listing. See also **character device**.
- bookmark** An invisible mark left in a Web document which allows a user to jump to that location directly without going through intermediate links. emacs also uses at a specific line location.
- boot block** A special area in every file system. For the main file system, this block contains the boot procedure and the table, while for others, it is left blank.
- broadcast** A message relayed by TCP/IP to all machines in a network to get the MAC address of a machine. All the bits of the host portion of the IP address are set to 1 for determining the broadcast address.
- buffer** A temporary storage area in memory or disk used to hold data. Used by vi and emacs to make a copy of a file before editing. Buffers are used for reading and writing data to disk and storing superblock and inode data.
